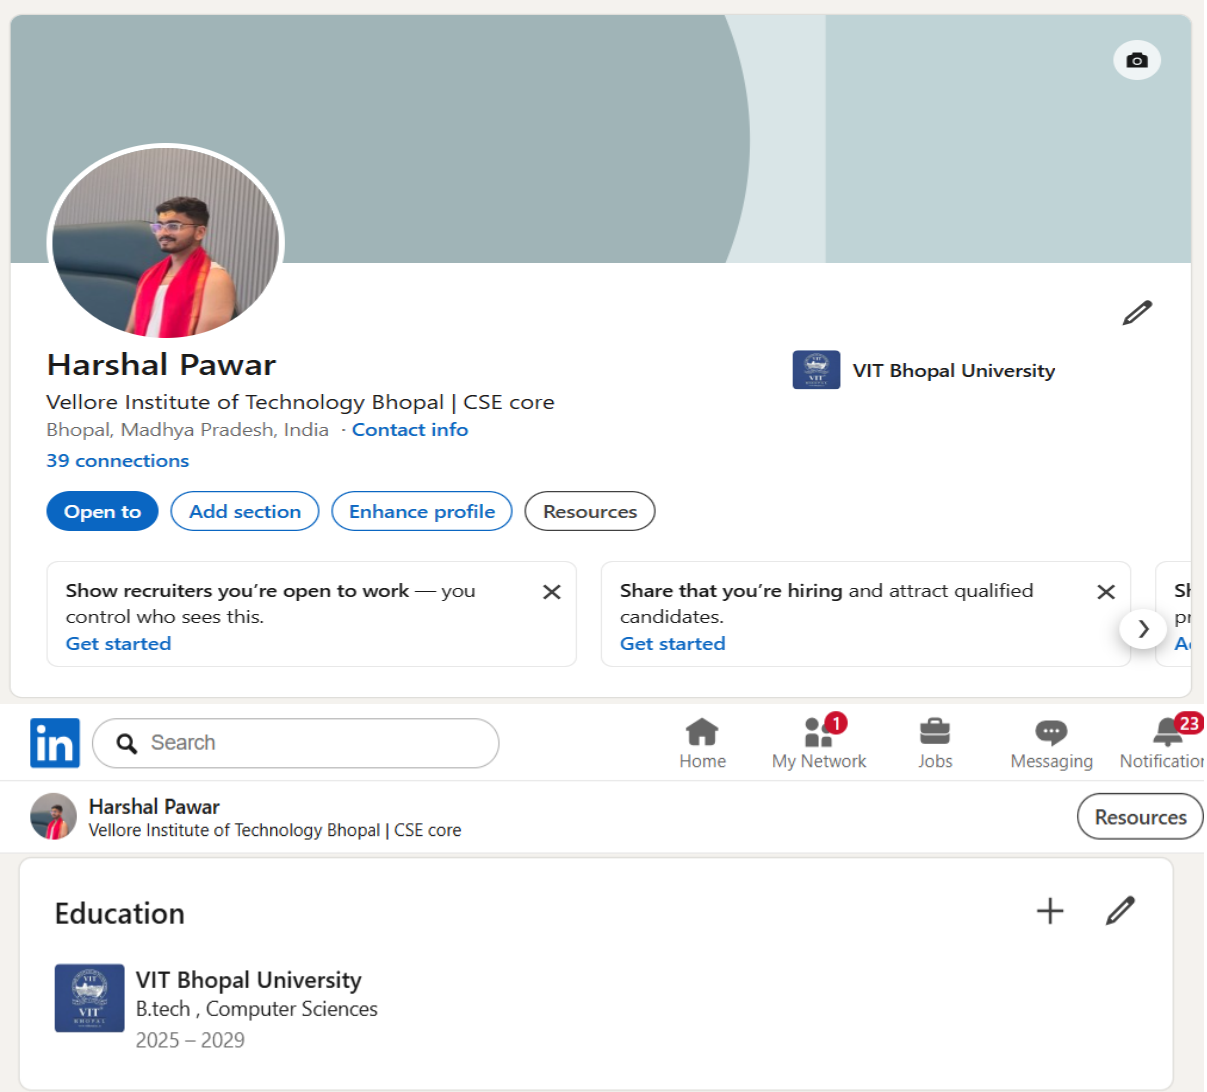
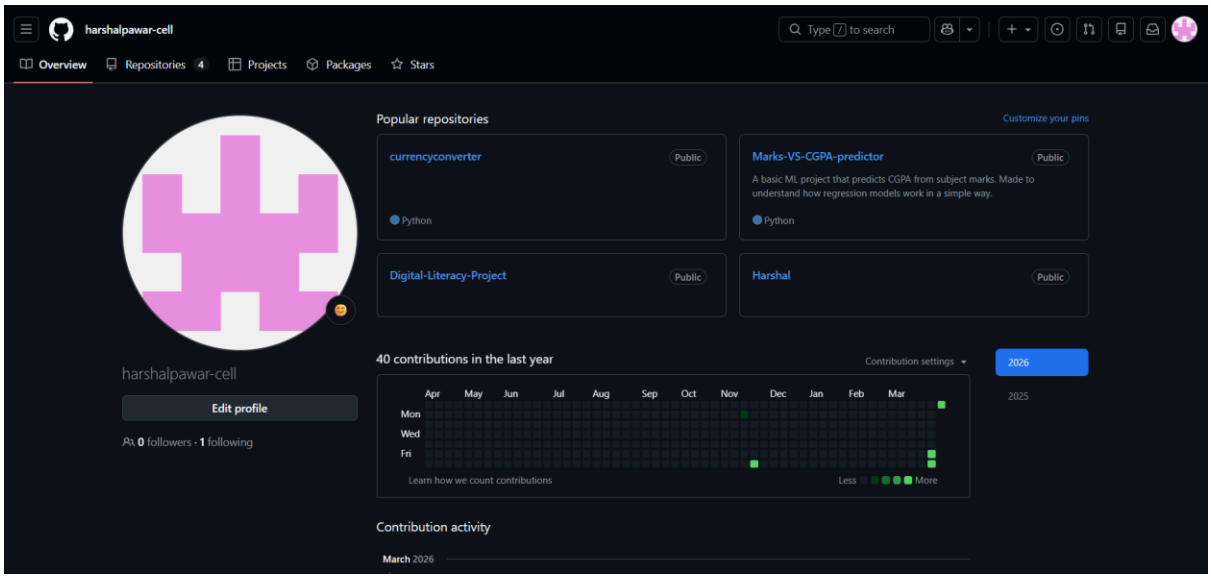
Task-2

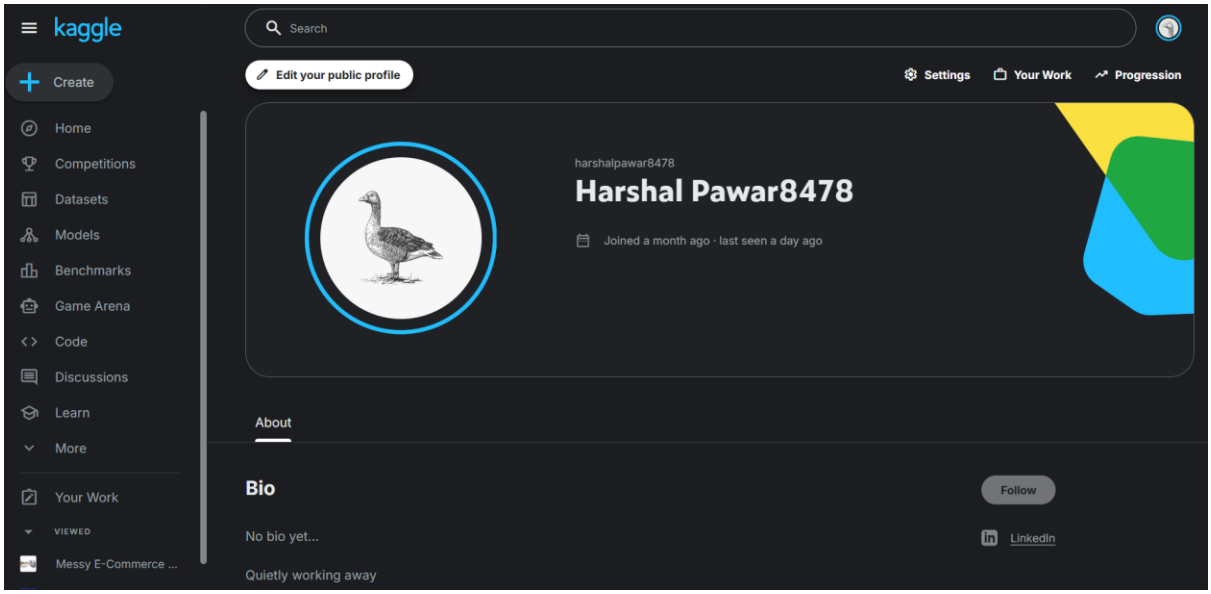
Linkedin:



Github:



Kaggle:



I chose LinkedIn, GitHub, and Kaggle because each of them serves a different purpose for students like me. LinkedIn is mainly used for building a professional profile and connecting with people from different fields. GitHub is useful for storing and sharing code, especially for programming and project work. Kaggle is a platform where we can practise data-related problems, work on datasets, and improve our skills in data analysis and machine learning.

Over the next four years, I plan to use LinkedIn to build my network and keep updating my achievements, internships, and projects. On GitHub, I will regularly

upload my coding projects and assignments so that I can track my progress and also show my work to others. Kaggle will help me practise more and participate in competitions, which will improve my problem-solving skills. Overall, these platforms will support my learning and help me prepare better for future career opportunities.
