In this task, I tried using a coding platform and also worked with a collaboration tool. For coding, I used HackerRank because I had heard about it before and it looked easy to start with. I solved one beginner level problem. At first, I was a bit confused about how to submit the code and check the output, but after trying once or twice I understood the process. It was a good experience because it felt like actual practice instead of just reading theory.

For the second part, I created a Google Form on digital literacy. I added 5 questions, including MCQs and one short answer question. It was interesting to see how responses get collected automatically in a sheet. I didn’t know earlier that it works like that.

Overall, I think these tools are quite useful for students. Coding platforms can help in improving logic step by step, and Google Forms can be used for surveys, quizzes, or even small projects. This task was simple but gave a practical idea of how these platforms are used.
